

# FLUTTER PROJECT

---

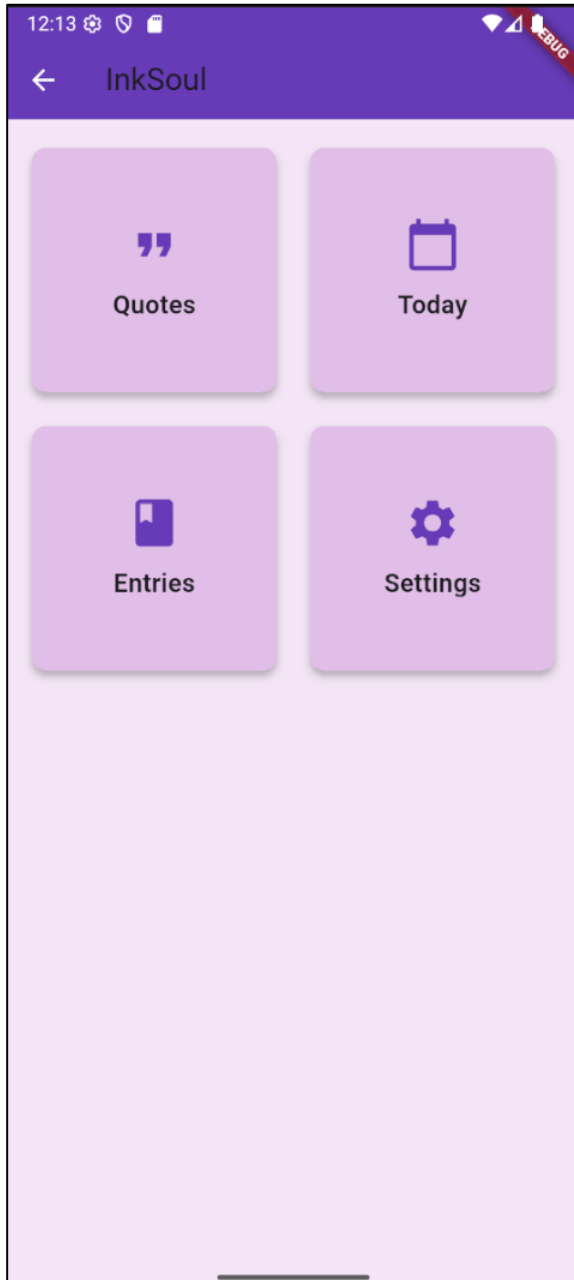

## INKSOUL-DIGITAL JOURNAL

DONE BY:  
K.Kalaivani

# InkSoul

- InkSoul is a **Flutter-based android journaling app** that allows users to capture their daily thoughts, moods, and reflections in a seamless and intuitive interface.
- The app provides a rich writing experience while integrating features like **mood tracking, quote inspiration, and bilingual support**.
- Users can **write, save, and revisit** their past entries, and even **delete** unwanted ones.
- InkSoul leverages **Firebase Firestore** for secure data storage and retrieval, ensuring a smooth and synchronized experience across devices.
- The app's elegant UI, featuring a soothing **purple theme**, enhances the writing experience, making it an ideal companion for anyone looking to cultivate a journaling habit.

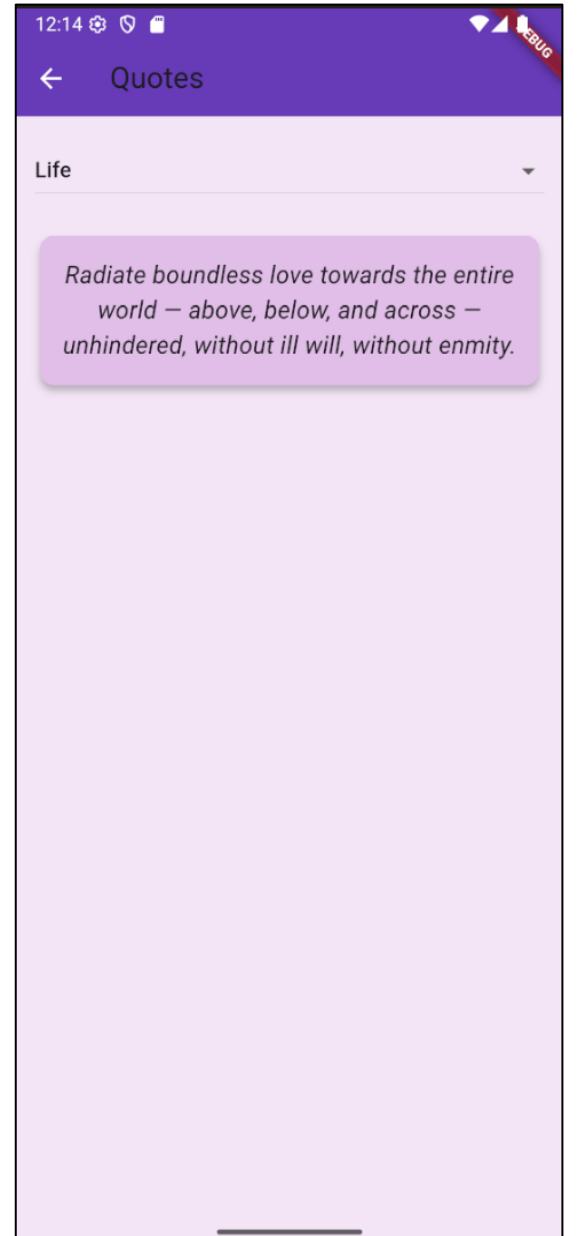

# Home Page

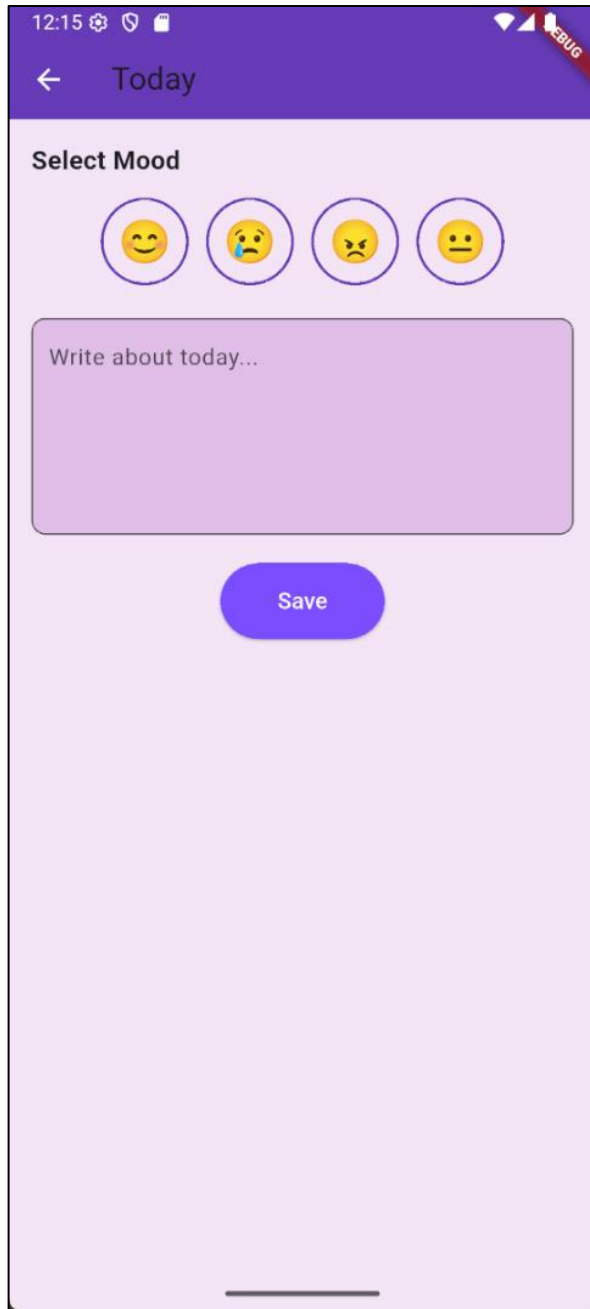

- Upon clicking **Get Started**, users are navigated to the **home page**, where they can explore the app's core features, presented as **card components** for an intuitive experience.
- The home screen consists of four main sections: **Quotes, Today, Entries, and Settings.**

# Quotes Page

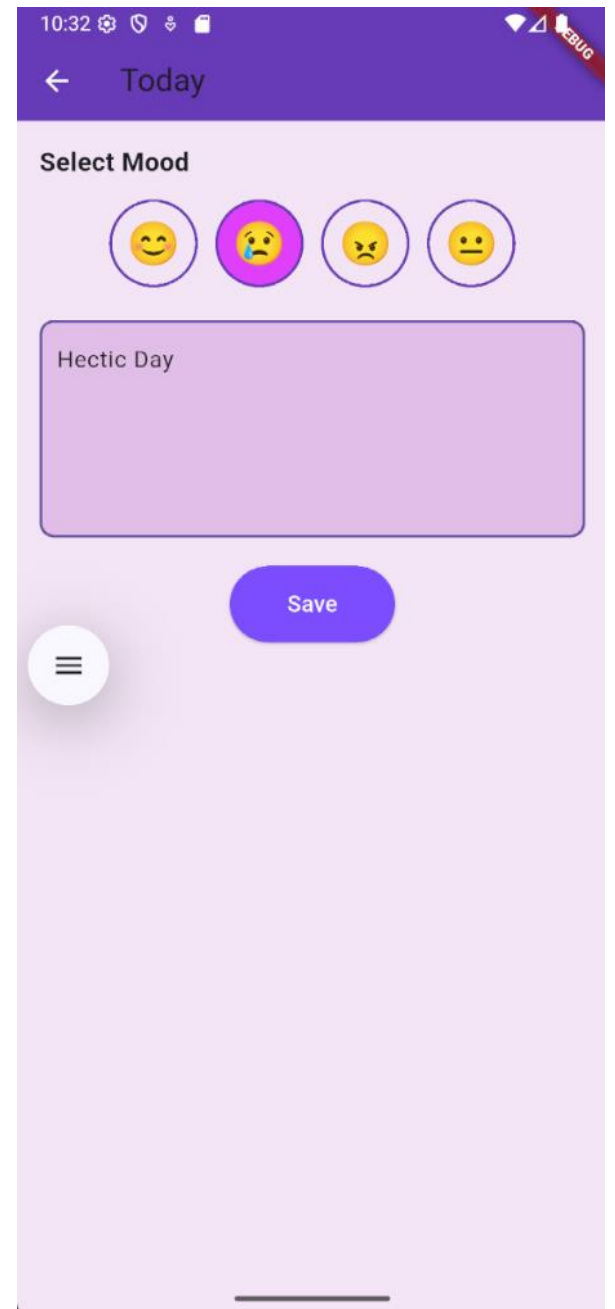

- The **Quotes** page features a **dropdown menu** that allows users to select from various **categories** such as love, life, inspiration, happiness, success, and more.
- Upon selecting a category, a **quote related to that theme is fetched** from an **external API** and displayed on the screen.
- This functionality enables users to discover meaningful and motivational quotes tailored to their interests.

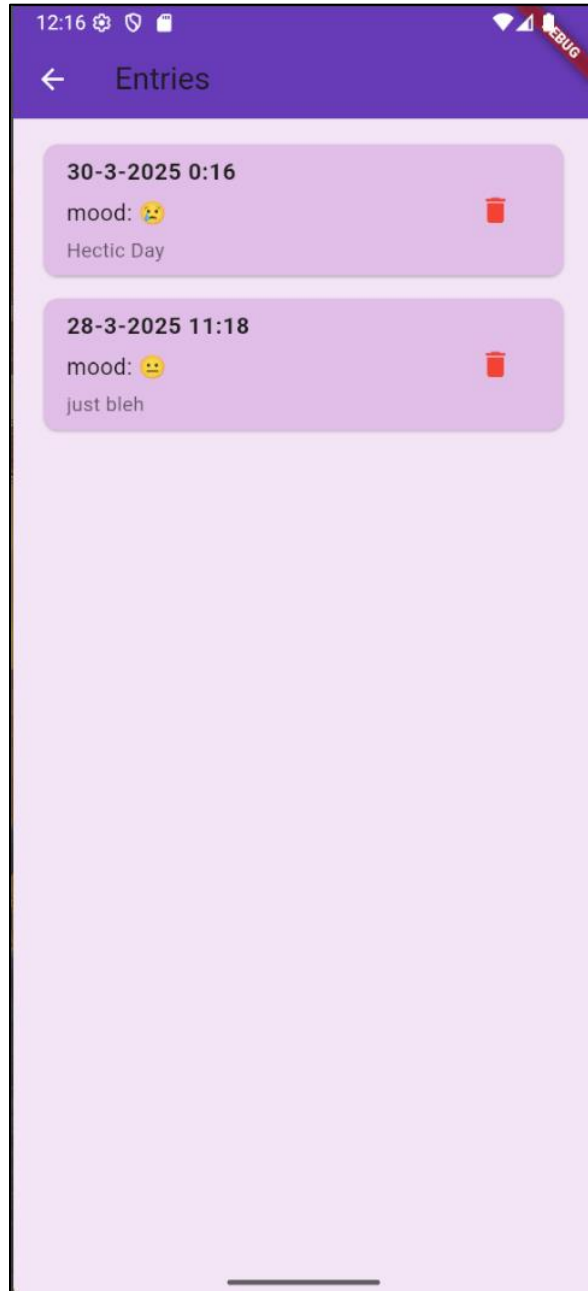

# Today Page

- The **Today** page allows users to **select their mood** from a set of predefined options and **write about their day** in a text entry field.
- This feature provides a simple and intuitive way for users to log their daily experiences and emotions.
- Once the entry is written and saved, it is **securely stored in the Firebase database**, ensuring that users can access their past reflections anytime.

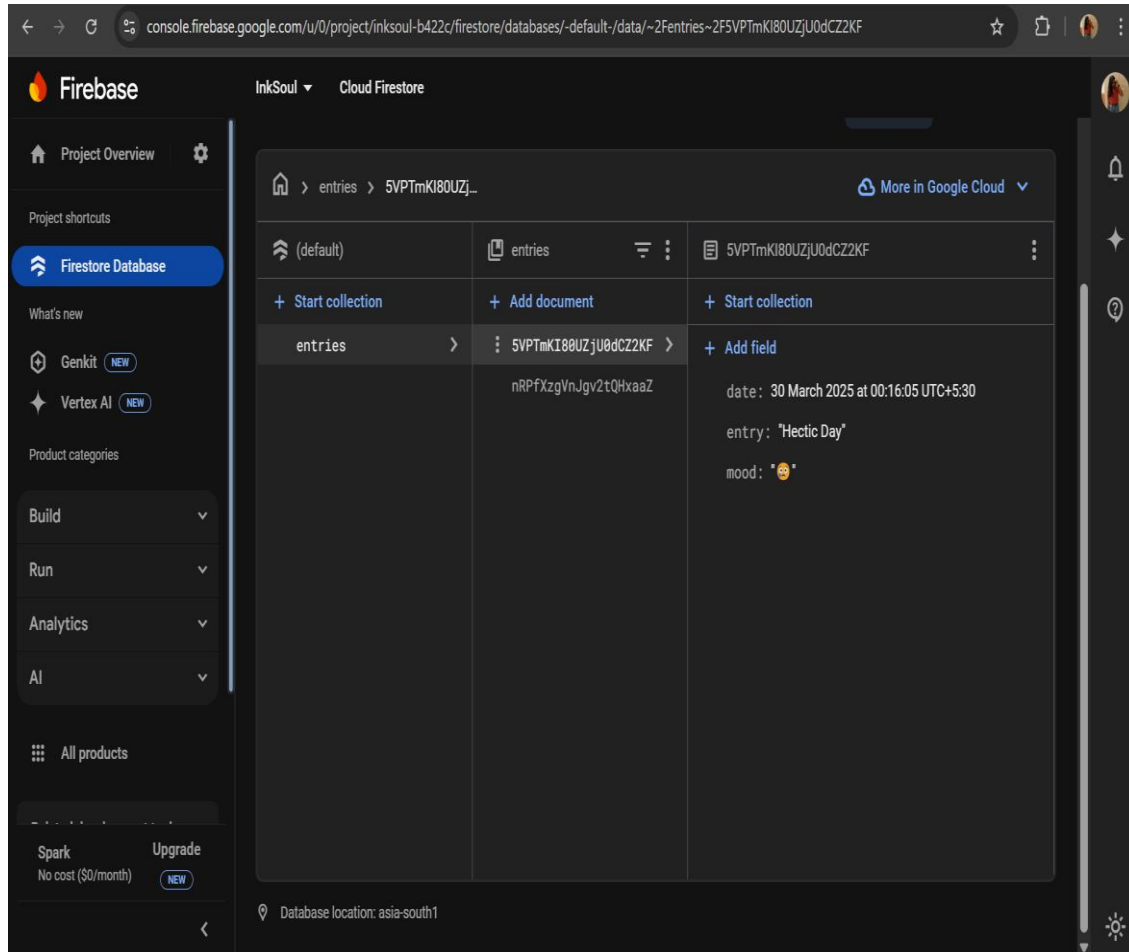

# Entries Page

- The **Entries** page displays a list of all previous journal entries made by the user, **retrieved from the Firebase database**.
- Each entry includes the **date, time, selected mood, and written content**, allowing users to revisit their past reflections easily.
- Additionally, the page features a **delete option**, enabling users to remove an entry if desired.
- When an entry is deleted, the change is **instantly reflected in the Firebase database**, ensuring that the stored data remains up to date.

# Firebase Database

- When a journal entry is created and saved, it is securely stored in the **Firebase database**, allowing users to access their past reflections anytime.
- The Entries page retrieves and displays these stored entries dynamically from **Firebase**.
- Additionally, any modifications, such as deleting an entry, are instantly reflected in the **Firebase database**, ensuring that the data remains synchronized and up to date, providing a smooth and consistent journaling experience.

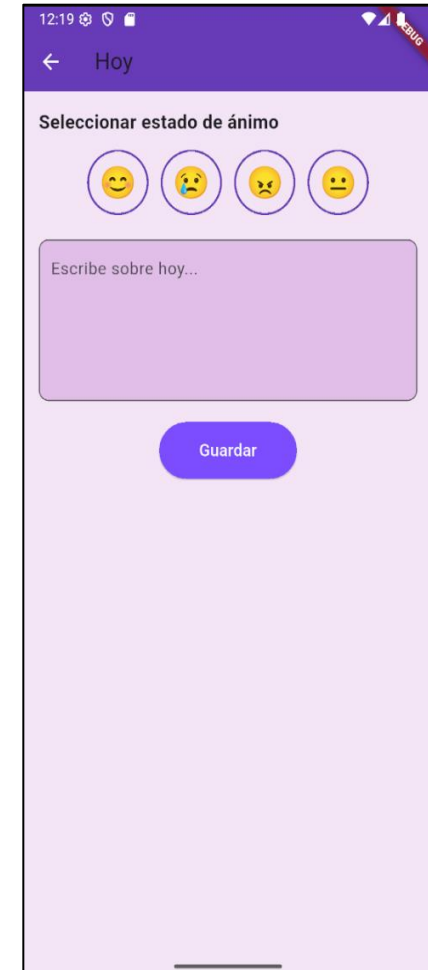

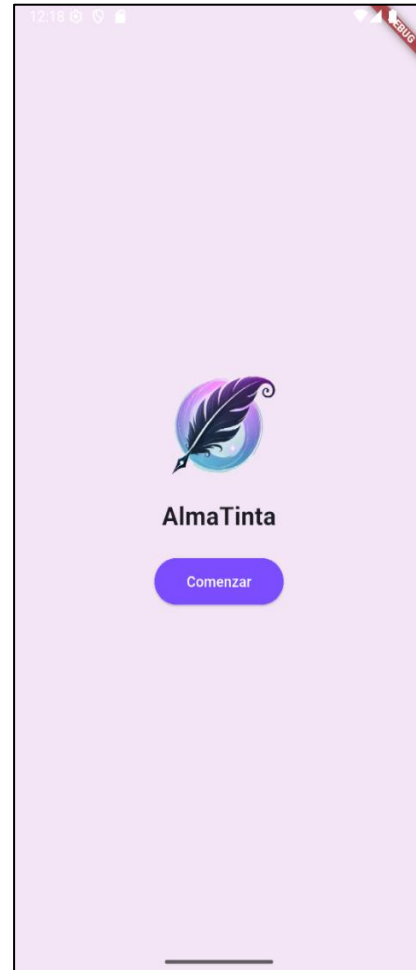

# Settings Page

- The **Settings** page includes a **language selection feature**, allowing users to **switch between English and Spanish**.
- By default, the app is set to **English**, but users can **change the language using a dropdown menu**.

# Localization Feature

# Conclusion

**InkSoul** project satisfies the conditions as follows:

- **Widgets** – Used various **Flutter widgets** for UI components (buttons, text fields, cards, etc.).
- **Stateless & Stateful Widgets** – Implemented both **stateless (EntriesPage)** and **stateful widgets (TodayPage)**.
- **Styling & Theming** – Used **AppColors** for consistent **theming and styling** across the app.
- **Layouts & Views** – Employed **Column, Row, ListView, and Card** for structuring different screens.
- **Navigation** – Implemented **navigation between screens** using `Navigator.push()` and `pop()`.
- **Gestures** – Uses **GestureDetector** (e.g., mood selection in TodayPage) and **buttons** for user interactions.
- **API Calling** – Fetched **quotes from an external API** (quotable.io).
- **Database** – Stored user entries in **Firestore Database**.
- **Firestore Integration** – Used **Firestore** for **data storage and retrieval**.
- **Localization** – Supports **English and Spanish** with a **dropdown-based language switcher**.
